

PRINCE JEFFERSON WEPIA ADDA

Accra, Ghana | +233 202059017 | Jeffersonadda123@gmail.com | github.com/jefferson-ai

EDUCATION

University of Ghana

BSc Computer Engineering

Accra, Ghana

Expected 2027

TECHNICAL SKILLS

Languages: Python, C++, Swift, JavaScript, TypeScript, SQL, HTML/CSS

Frameworks & Libraries: SwiftUI, React, Next.js, Node.js, Combine

Databases & Backend: PostgreSQL, MySQL, Supabase

Developer Tools & Technologies: Git, GitHub, Linux, GStreamer, REST APIs, Raspberry Pi

Areas: Full-Stack Development, iOS Development, Machine Learning, Computer Vision, Edge AI, LLM Applications

EXPERIENCE

Computer Vision Engineering Intern

2026–Present

University of Ghana, Department of Computer Engineering

- Developing a Python, YOLO, and Raspberry Pi computer vision system to detect and track crop-threatening birds in real time for automated agricultural pest deterrence.
- Evaluating global-shutter imaging, Sony IMX296 sensors, and GStreamer pipelines to reduce motion artifacts and optimize camera-to-inference latency on resource-constrained edge hardware.
- Researching acoustic bird deterrence and designing integration between real-time detection and automated speaker-based responses.

Freelance Web Developer

Jan 2025–Present

- Develop responsive websites and web applications for small businesses, translating client requirements into polished interfaces and intuitive user experiences using HTML, CSS, and JavaScript.
- Build product catalogs, shopping interfaces, and interactive forms, organizing content and navigation to help customers explore products and services across desktop and mobile devices.

Technical Support Volunteer — University of Ghana

Mar 2025–Sep 2025

- Diagnosed and resolved hardware, software, connectivity, and system-configuration issues for students and faculty.
- Assisted with software installation, network troubleshooting, system setup, and cybersecurity best practices.

PROJECTS

XKEEP — Personal Finance Application | Swift, SwiftUI, Supabase, PostgreSQL

- Engineered a native iOS app with Swift/SwiftUI and MVVM for 100+ student beta testers, supporting expense tracking, budgeting, savings goals, and spending analytics.
- Integrated Supabase Auth, PostgreSQL, async/await, Combine, and real-time subscriptions; enforced user-specific access to financial records with Row Level Security.
- Built Edge Functions, financial aggregation logic, Home Screen widgets, and Face ID/Touch ID authentication for secure, real-time budget insights and spending and savings tracking.

Patriot — Emergency Coordination Platform | Swift, Mobile Prototyping, Backend Integration

- Developed the iOS prototype and incident-reporting flow for a visual-first platform designed to route citizen reports into Ghana's 112 emergency-response ecosystem.
- Implemented image capture, GPS/location metadata, incident details, and severity inputs for structured reports feeding downstream classification and routing systems.
- Contributed to backend integration and incident-data handling between the prototype client and agency-facing emergency coordination workflows.

LLM Cost Autopilot — In Progress | Python, OpenAI API

- Building an LLM observability and cost-management tool to monitor API usage, model selection, token consumption, latency, and estimated inference cost across application requests.
- Implementing OpenAI API request instrumentation and usage tracking to give developers visibility into model performance and application-level LLM spending.

School Enrollment System | JavaScript, HTML, CSS, MySQL

- Led a 5-person engineering team building a database-driven enrollment platform for registration and course selection for 200+ students.
- Designed and integrated a MySQL relational database for student records, course data, enrollment relationships, and administrative operations.
- Built an administrative dashboard and client-side validation to manage enrollment data, reduce manual record processing, and improve registration visibility.
